2.1 Overview by Study Progress 5

2.2 Overview by Study Modules 6

3. Module Descriptions 8

1. Outline of the Program

The Biomedical Technologies master's program responds to the ever-growing need for qualified specialists within biomedical and technical field. The aim of the Master's course is to qualify for a research-related professional activity in this field. It has been designed to provide a broad base of knowledge and the opportunity to specialize in the field of Bioimaging, Biomedical Engineering or NanoBioAnalytics.

The Master's program in Biomedical Technology is a consecutive, research-oriented program, which leads to a Master of Science (M. Sc.) degree. It lasts two academic years and includes a total of 120 ECTS.

The two-year curriculum is divided into two main parts:

In the first year the students are concentrating on deepening knowledge and advanced laboratory research training, acquiring broad competences in the field of biomedical technologies, including specific knowledge in the fields of bioimaging, nanotechnology and biomedical engineering. Students can also choose from a wide catalog of elective modules allowing the student to tailor the program to their individual interests.
In the second year two Practical work experiences and Master Thesis Research Project form a major component of the program and entails one year of full-time practical work in the laboratory on three different research projects. In that way the graduates of the master's program train analytical thinking and judgment as well as practical research skills and knowledge.

The teaching of "soft skills" such as communication, presentation techniques and project management (e.g. module MEDTECH Innovation), which are an integral part of many modules, also plays an important role. In addition to deepening their technical and methodological skills, the students also develop their social and communication skills with Teamwork and Presentation Techniques as well as Consideration of social and ecological aspects (e.g. module Ethical and Social Aspects of Biomedical Technologies) so that they can apply different working and communication styles. In addition to the written master's thesis an oral presentation has to be completed in front of the experts, in which the graduates must represent the results of their research.

Objectives of the Program

Graduates of the Biomedical Technologies M.Sc. are qualified and well prepared for professional careers in the field of academic research or in the industry. They have comprehensive theoretical and practical expertise in different biomedical technologies and laboratory techniques and methods.
The course is to impart a profound knowledge of regulatory affairs in the field of medical devices from patenting to approval including mandatory quality control measures.
According to the chosen specializations (two out of three possible) graduates have in-depth expertise either in the field nanotechnology for medical applications including soft matter and polymer physics, mechanics of cells and tissues, physics of the cytoskeleton, cellular forces, motor proteins, methods in nanobiophysics, high resolution microscopy techniques, micro- and nano-fluidics, lab-on-a-chip technology and/or clinical and preclinical imaging including MRT, PET, CT, SPECT and optical

imaging and/or biomedical engineering including tissue engineering, biomaterials, reactor technology, operational procedures, design and use of clinical trials.

Graduates of the Master's program are able to plan and perform independent experiments to answer scientific questions ranging from molecular biology to biochemical composition of the materials. They have the expertise to analyze, interpret and statistically evaluate obtained results and to present them in from of scientific community.

Language requirements:

English is the main language of instruction and examination including master’s thesis and oral presentation. The required level of English is C1. Knowledge of German is not obligatory for the degree program but will make everyday life in Tübingen and socialization easier. Few elective courses are offered in German as well.

2. Curriculum

2.1 Overview by Study Progress

2.2 Overview by Study Modules

The program for *Biomedical Technologies* consists of the following modules:

No	Module Name	ECTS
	Mandatory courses	
M1	***Biomedical Technologies in Diagnostic and Therapy***	6
M2	***Laboratory Techniques and Methods***	3
M3	***Regulatory Affairs of Medical Devices***	3
M4	***Clinical cases and Consequences for Medical Devices***	6
	Specialization areas *2 out of 3 of the following specialization areas each with lecture, seminar and labwork with 15 ECTS in total have to be chosen*	
S1	***Bioimaging***	15
S1V	*Bioimaging – Lecture and Seminar*	6
S1P	*Bioimaging – Labwork*	9
S1PWE	*Bioimaging – Practical work experience**	15
S2	***NanoBioAnalytics***	15
S2V	*NanoBioAnalytics – Lecture and Seminar*	6
S2P	*NanoBioAnalytics – Labwork*	9
S2PWE	*NanoBioAnalytics – Practical work experience**	15
S3	***Biomedical Engineering***	15
S3V	*Biomedical Engineering – Lecture and Seminar*	6
S3P	*Biomedical Engineering – Labwork*	9
S3PWE	*Biomedical Engineering – Practical work experience**	15
	Elective courses *Modules comprising 12 ECTS in total have to be chosen*	
AS4.1	***Bioimaging – Lecture and Seminar only***	6
E2	***NanoBioAnalytics – Lecture and Seminar only***	6
E3	***Biomedical Engineering– Lecture and Seminar only***	6
E4ST	***Aktorik in der Gerätetechnik***	6
E6ST	***Interface-Design***	6
E7ST	***Grundlagen der Keramik und Verbundwerkstoffe***	6

E10ST	***Optische Systeme in der Medizintechnik***	6
BM8	***Biostatistics***	6
E13	***Ethical and Social Aspects of Biomedical Technologies***	3
E14	***MEDTEC Innovation***	9
E15	**MRI-applications for neuroscientific and clinical research**	6
E16	***Medical Technology Aspects of Cardio-Vascular Medicine***	3
E1	***NanoBioPhysics and scanning probe microscopy***	3
BM14	***Python course***	6
E17	***Biostatistics of Clinical Studies***	3
MT	***Master Thesis****	30
	**Can also be completed in industry or abroad and have to be performed within the selected specialization areas!*	

6. Module Descriptions

Number: M1	**Title:** *Biomedical Technologies in Diagnostic and Therapy*			**Nature:** compulsory
Credit points	6 CP			
Work load **- contact hours (SWS)** **- self study**	Total: 180 h contact hours: 60 h (2 SWS per semester) self-study (preparation for exams included): 120 h			
Duration	1 semester			
Time schedule	The module is offered only in the winter term.			
Language	English			
Number of participants	Minimum: 5			
Structure /Teaching methods	lecture (4 SWS)			
Contents	The course provides important and up-to-date knowledge of different biomedical technologies: Heart-lung machine, artificial respiration, anaesthetic technique, computer-assisted surgery, electromedical technique, electronic implants, rehabilitation technology, biocompatible prosthesis, biomedical laser applications			
Objectives	After completion of this module, students will be able to understand the state-of-the-art technologies, modern methodologies and open questions in selected fields of biomedical technologies. The students know a selection of relevant biomedical technologies and can analyse compare the advantages and disadvantages. The students are able to evaluate biomedical technologies and know the different requirements for the use of biomedical technologies			
Requirements for credit points / exams and grading scheme (where appropriate, weighting)	course	assessment	Grading scheme	weighting
	Biomedical Technologies in Diagnostic and Therapy	Written examination	1-5	6 ECTS
Applicability	M.Sc. in Biomedical Technologies (mandatory course) and M.Sc. Medizintechnik, Universität Stuttgart (elective course)			
Recommended semester	1st Semester			
Participation requirements	B.Sc. degree			
Person responsible	Dr. Jonas Johannink			
Literature / Teaching materials	Texts and books will be announced at the beginning of term.

</table>

Number: M3	**Title:** *Regulatory Affairs of Medical Devices*			**Nature** compulsory
credit points	3 CP			
work load **- contact hours (SWS)** **- self study**	Total: 90 h contact hours: hybrid 30 h (2 SWS per semester) self-study (preparation for exams included): 60 h			
Duration	1 semester			
Time schedule	The module is offered only in the summer term.			
Language	English			
Number of participants	Minimum: 5			
Structure /Teaching methods	- Pre-recorded lectures which will be updated regularly - seminar 1x per month - 1 compulsory online questionnaires for every lecture - Total 2 SWS Pre-recorded lectures will be made available to the students, it is their individual responsibility to study the subject. In the case of regulatory affairs, pre-recorded lectures are well suited, as the turnover rate of the legal foundation, on which they are based, is slow compared to technological advancements. Nevertheless, lectures will be updated as soon as new laws and requirements arise. Progress will be monitored via compulsory online questionnaires (1 questionnaire per lecture, 3-5 multiple choice questions per lecture), which need to be completed within 1 week after the lecture. Questionnaires will be graded in the standard grading scheme (1-5). Missed questionnaires will be graded with 5. Seminars will be held once per month to summarize lecture topics and clarify questions.			
Contents	<u>Thematic focus:</u> - regulatory affairs, patents, quality control, audits, startups - quality, risk and project management - incorporation of industry-based lectures The course provides important and up-to-date knowledge regarding regulatory affairs in the field of medical devices. The students will learn about the implemented mandatory safety strategies that ensure high quality materials and products in both academia and industry. These include, yet are not limited to, regulatory affairs, patenting and auditing. Additionally, measures to maintain quality will be highlighted by experts from academia and industry, including quality control and management. As universities are encouraging students to found spin-offs, students will gain insights on the objectives, hurdles and opportunities of creating their own startups from knowledgeable experts.			
Objectives	After the course, students will be able to - classify medical devices in corresponding regulations - recapitulate requirements for medical device in order to be patented and approved - describe the life cycle of a medical device from patenting to approval including mandatory quality control measures - recapitulate methods to ensure quality in an academic and industrial context			
Requirements for credit points / exams and grading scheme	course	Assessment consists of following parts	Grading scheme	weighting

(where appropriate, weighting)	Regulatory Affairs of Medical Devices	Final test 1 online questionaires per lecture 1 seminar presentation	1-5 1-5 1-5	1.5 ECTS (50%) 0.6 ECTS (20%) 0.9 ECTS (30%)
	All grades from the online questionnaires throughout the semester will be averaged and count 20% of the overall grade. A minimum passing grade (4.0) on average is a prerequisite to be eligible for the final test.			
Applicability	M.Sc. in Biomedical Technologies (mandatory course) and M.Sc. in Medizinische Strahlenwissenschaften/ Medical Radiation Sciences (elective course)			
Recommended semester	2nd semester			
Participation requirements	B.Sc. degree			
Person responsible	Schenke-Layland, Katja, Prof. Dr. katja.schenke-layland@uni-tuebingen.de			
Literature / Teaching materials	Texts and books will be announced at the beginning of term.			

Number: M4	**Title:** *Clinical Ccases and Consequences for Medical Devices*			**Nature** compulsory
Credit points	6 CP			
Work load **- contact hours (SWS)** **- self study**	Total: 180 h contact hours: 60 h (4 SWS) self-study (preparation for exams included): 120 h			
Duration	1 semester			
Time schedule	The module is offered once a year starting with lecture I in the winter term.			
Language	English			
Number of participants	Minimum: 5			
Structure /Teaching methods	lecture (4 SWS)			
Contents	<u>Thematic focus:</u> The course provides up-to-date knowledge of different clinical cases (e.g., brain diseases), diagnostic and therapeutic procedures (e.g., neuromodulation), the potential, limitations and future perspectives of medical technology devices.			
Objectives	After completing the module, students will have - knowledge of the symptoms, pathophysiology, demographics and epidemiology of different clinical cases, - an understanding of different diagnostic and therapeutic procedures, - the ability to assess the potential and limitation of pharmacological and non-pharmacological interventions, - knowledge of the state-of-the-art of medical technology devices and the skill to evaluate them from a clinical perspective, - an understanding of unresolved therapeutic challenges and the ability to develop ideas and strategies to overcome them, - the ability to anticipate future trends and perspectives in medical technology.			
Requirements for credit points / exams and grading scheme (where appropriate, weighting)	course	exam	Grading scheme	weighting
	Clinical Cases and Consequences for Medical Devices	Written exam	1-5	6 ECTS
Applicability	M.Sc. in Biomedical Technologies (mandatory course) and M.Sc. in Medizinische Strahlenwissenschaften/ Medical Radiation Sciences (elective course), M.Sc. Neuroscience, GTC (elective course), M.Sc. Cognitive Science (elective course)			
Recommended semester	2nd semester			
Participation requirements	B.Sc. degree			
Person responsible	Gharabaghi, Alireza, Prof. Dr. med.			
Literature / Teaching materials	Texts and books will be announced at the beginning of term. There is no general script.

Number: E7ST	**Title:** *Grundlagen der Keramik und Verbundwerkstoffe*	**Nature:** elective course
Credit points	6 CP	
Work load **- contact hours (SWS)** **- self study**	Total: 180 h contact hours: 42 h self-study (preparation for exams included): 138 h	
Duration	2 semesters	
Time schedule	The module is offered once per year	
Language	German	
Number of participants	Maximum: 20	
Structure /teaching methods	Lecture	
Contents	Dieses Modul hat die werkstoff- und fertigungstechnischen Grundlagen keramischer Materialien zum Inhalt. Darüber hinaus werden konstruktive Konzepte und die werkstoffspezifische Bruchmechanik berücksichtigt. Es werden keramische Materialien und deren Eigenschaften erläutert. Keramische werden gegen metallische Werkstoffe abgegrenzt. Anhand von ingenieurstechnischen Beispielen aus der industriellen Praxis werden die Einsatzgebiete und -grenzen von keramischen Werkstoffen aufgezeigt. Den Schwerpunkt bilden die Formgebungsverfahren von Massivkeramiken. Die theoretischen Inhalte werden durch Praktika vertieft und verdeutlicht. Stichpunkte: - Grundlagen von Festkörpern im Allgemeinen und der Keramik. - Einteilung der Keramik nach anwendungstechnischen und stofflichen Kriterien, Trennung in Oxid-/ Nichtoxidkeramiken und Struktur-/ Funktionskeramiken. - Abgrenzung Keramik zu Metallen. - Grundregeln der Strukturmechanik, Bauteilgestaltung und Bauteilprüfung. - Klassische Herstellungsverfahren vom Rohstoff bis zum keramischen Endprodukt. - Formgebungsverfahren, wie das Axialpressen, Heißpressen, Kalt-, Heißisostatpressen, Schlicker- , Spritz-, Foliengießen und Extrudieren keramischer Massen. - Füge- und Verbindungstechnik. - Sintertheorie und Ofentechnik. - Industrielle Anwendungen (Überblick und Fallbeispiele).	
Objectives	Die Studenten können: - Merkmale und Eigenheiten keramischer Werkstoffe unterscheiden, beschreiben und beurteilen. - Belastungsfälle und Versagensmechanismen verstehen und analysieren. - werkstoffspezifische Unterschiede zwischen metallischen und keramischen Werkstoffen wiedergeben und erklären. - Technologien zur Verstärkung von Werkstoffen sowie die wirkenden Mechanismen benennen, vergleichen und erklären. - Verfahren und Prozesse zur Herstellung von massivkeramischen Werkstoffen benennen, erklären, bewerten, gegenüberstellen, auswählen und anwenden.	

	- Herstellungsprozesse hinsichtlich der technischen und wirtschaftlichen Herausforderungen bewerten und anwendungsbezogen auswählen. - in Produktentwicklung und Konstruktion geeignete Verfahren und Stoffsysteme identifizieren, planen und auswählen. - Werkstoff- und Bauteilcharakterisierung erklären, bewerten, planen und anwenden.

Number: E13	**Title:** *Ethical and Social Aspects of Biomedical Technologies*	**Nature:** Elective course

Credit points	3 CP			
Work load **- contact hours (SWS)** **- self study**	Total: 90 h contact hours: 30 h self-study (preparation for exams included): 60 h			
Duration	1 semester			
Time schedule	The module is offered once per year in the summer term			
Language	English			
Number of participants	Maximum: 20 Minimum: 6			
Structure /Teaching methods	Seminar (2 SWS)			
Contents	Basics: - What makes and innovation a good innovation? - What are ethical and social aspects of biomedical technologies? - How to deal with those aspects? Joint case study of a particular biomedical technology: - What is the case? - How can we detect ethical and social aspects of the case? - How to deal with those aspects? Individual case studies of the technologies the students develop in their master thesis: - Which ethical and social aspects has my own work? - How can I deal with them?			
Objectives	- The students reflect their criteria for good innovations and get to know the debates about responsible, sustainable innovation. - The students get an idea of what ethical and social questions are. They become familiar with ethical and social scientific research on biomedical technologies. - The students are empowered to detect and to discuss ethical and social aspects of the technologies they develop. They get to know tools which support ethical and social reflections.

<tr><td>Contents</td><td colspan="4">MRI has widely increased our knowledge about the structure and function of the human brain. The continuous development of new technologies and methods in this field allow investigations to be carried out at an ever-increasing level of detail. In this course, established and emerging methods that allow robust and reproducible quantification of physiologic and pathologic processes will be taught.
Topics include:
- Non-invasive imaging of tissue
- MR principles
- Tissue structure and MRI of gray matter regions
- White matter (WM) microstructure and diffusion weighting (DWI)
- Mapping long-range connections, brain plasticity and neurodegeneration using DWI
- MRI of WM using non-diffusion techniques
- Mapping brain function, structure: connectome networks and radiomics
- How structure and function modify local magnetic susceptibility
- Contrast agents for cell-labelling and studies of the ‘glymphatic’ system
- Neurochemistry and multi-nuclear magnetic resonance spectroscopy
- MRI at high magnetic field strengths – Visit of the MRZ</td></tr>
<tr><td>Objectives</td><td colspan="4">After completion of the module students know how does connectivity analyses relate to the progression of neurodegenerative diseases. They are able to investigate the anatomical microstructure. Students can measure the function of the blood-brain-barrier. Students follow the fate of stem-cells within the anatomical microstructure by MR.</td></tr>

Contents	The Python Programming Fundamentals is an immersive and comprehensive course designed to equip students with a strong foundation in Python, one of the most popular and versatile programming languages. Throughout this course, students will embark on a journey that takes them from the basics of Python syntax to advanced concepts, enabling them to become proficient Python programmers. The main covered topics are data structures, operators and control structures, functions, I/O operations, object-oriented programming and several advanced libraries for tasks such as data analysis. The course is designed for students with little or no programming background.			
Objectives	Students acquire basic knowledge of Python syntax. They develop an understanding of data structures, operators, and control structures in Python. Students gain the ability to create and use functions in Python and gain knowledge of input and output operations in Python. They develop an understanding of object-oriented programming in Python and gain skills in using advanced libraries for tasks such as data analysis, as well as programming independently in Python to become a proficient Python programmer.			
Requirements for credit points / exams and grading scheme (where appropriate, weighting)	course	exam	Grading scheme	weighting
	seminar	Written examination	1-5	6ECTS
Applicability	This module is a compulsory module in the Master's program Strahlenwissenschaften/Medical Radiation Sciences, profile area "Artificial Intelligence in Med. Radiation Sciences" and an elective course for Biomedical Technologies M.Sc.			
Recommended semester	1st semester			
Participation requirements	B.Sc. degree			
Person responsible	tba			
Literature/Teaching materials	tba			

Number: E 17	**Title:** ***Biostatistics of Clinical Studies***			**Nature:** Elective course
Credit points	3 CP			
Work load **- contact hours (SWS)** **- self study**	Total: 90 h contact hours: 45 h self-study (preparation for exams included): 90hours			
Duration	1 Semester			
Time schedule	Annual			
Language	English			
Number of participants	Lecture: no limit Tutorial: max. 28 participants			
Structure/ Teaching methods	Lecture 1 (2 SWS), Tutorial (1 SWS) (elective, English) 3 ECTS			
Contents	• Statistical methods for clinicial studies • sample size estimation • sequential and adaptive designs • diagnostic studies • studies with censored data			
Objectives	The students can develop statistical modelling and analysis of experiments, interventional and observational clinical studies and of epidemiological studies. They can interpret the results. The students have knowledge of statistical analysis (descriptive, confirmatory, regression, multivariate) and they can decide which method is the most adequate in a specific study.			
Requirements for credit points / exams and grading scheme (where appropriate, weighting)	Course	Assessment	Grading Scheme	Weighting
	Tutorial	Daily Exercise Sheets	Passed or failed	3 ECTS
Applicability	M.Sc Biomedical Technology and M.Sc Medizinische Strahlenwissenschaften			
Recommended semester	1st / 2nd Semester			
Participation requirements	The knowledge of the Course Statistics 1 is required to attend the ANOVA			
Person responsible	Martus, Peter, Prof. Dr. rer. nat. Peter.martus@med.uni-tuebingen.de			
Literature/ Teaching materials	To be announced at the beginning of the term			

Number: MT	**Title:** *Master Thesis*	**Nature:** compulsory
Credit points	30 CP	
Work load **- contact hours (SWS)**	Total: 900 h contact hours: 600 h	

- self study	self-study: 300 h			
Duration	6 months			
Frequency of the offer	each semester			
Language of instruction	English			
Number of participants	maximal 24			
Teaching methods	seminar (3 SWS), practical work (40 SWS)			
Content	depending on the project			
Qualification goals	Students are able to study published data to get insight a research field At the end of the master thesis the students should be able to develop an own research project idea and design and perform the appropriate experiments with help of published data. They understand the general flow from the idea of an experiment via the experimental design and methodology to interpretation of the results taking sufficient and appropriate controls and published data into account They have expertise in documentation, oral and written presentation of experimental data			
Requirements for credit points / exams and grading scheme (where appropriate, weighting)	course	assessment	Grading scheme	weighting
	Master Thesis	- oral presentation - written thesis	1-5 1-5	20% 80%
Usability	M.Sc. in Biomedical Technologies			
Recommended semester	4th semester			
Prerequisite to attend the activities	Successful completion of the theoretical and practical course work in the 1st, 2nd and 3rd semester			
Person responsible	The head of the examination committee			
Teacher	Various teachers of the faculty of Medicine, faculty of Science and Biomedical Technologies Industry			
Literature/Teaching materials	will be provided by the supervisor before start of master thesis
